Ocean County Vocational-Technical School District

Dear School Community,

Our school system is committed to protecting student, teacher, and staff health. To protect our community and be in compliance with the Department of Education regulations, the Paramus School District began testing our schools’ drinking water for lead.

In accordance with the Department of Education regulations, the District has implemented immediate remedial measures for any drinking water outlet with a result greater than the action level of 15 µg/l (parts per billion [ppb]). This includes turning off the outlet, providing an alternate water source, and leaving the outlet off until re-sampling shows results below the action level.

Results of our Testing
Following instructions given in technical guidance developed by the New Jersey Department of Environmental Protection, we completed a plumbing profile for each of the buildings within Ocean County Vocational-Technical School District. Through this effort, we identified and tested all drinking water and food preparation outlets. Of the 81 samples taken, all but 5 tested below the lead action level established by the US Environmental Protection Agency for lead in drinking water (15 µg/l [ppb]).

The table below identifies the drinking water outlets that tested above the 15 µg/l for lead on a 1st-Draw sample, the actual lead level, and what temporary remedial action has taken to reduce the levels of lead at these locations.

<table>
<thead>
<tr>
<th>Sample Location</th>
<th>Results (µg/l or ppb)</th>
<th>Remedial Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Toms River Center Adult Evening School Office Sink</td>
<td>20</td>
<td>Disconnected outlet and bottled water provided</td>
</tr>
<tr>
<td>Toms River Center Facility &amp; Grounds-inside spigot</td>
<td>16</td>
<td>Outlet not used for drinking; Posted signage to reinforce message</td>
</tr>
<tr>
<td>Brick Center Main Kitchen-Coffee Machine supply line, upstream of Filter</td>
<td>25</td>
<td>Alternate water supply provided; Filter will be changed and outlet re-sampled before returning to service</td>
</tr>
<tr>
<td>Brick Center Work Station #34 faucet</td>
<td>32</td>
<td>Outlet will not be used for cooking; Posted signage to reinforce message</td>
</tr>
<tr>
<td>Brick Center Equipment Station #34, tilt-in skillet</td>
<td>23</td>
<td>Outlet will not be used for cooking; Posted signage to reinforce message</td>
</tr>
</tbody>
</table>

Water taps at the locations where sampling results exceed the lead action level established by the US Environmental Protection Agency for lead in drinking water (15 µg/l [ppb]) have been taken out of service. Some of these locations are in the process of or have been changed out with new water fixtures while the others remain shut off and out of service. None of these locations will be returned to active service until an acceptable sampling result for lead is obtained there.
Health Effects of Lead
High levels of lead in drinking water can cause health problems. Lead is most dangerous for pregnant women, infants, and children under 6 years of age. It can cause damage to the brain and kidneys, and can interfere with the production of red blood cells that carry oxygen to all parts of your body. Exposure to high levels of lead during pregnancy contributes to low birth weight and developmental delays in infants. In young children, lead exposure can lower IQ levels, affect hearing, reduce attention span, and hurt school performance. At very high levels, lead can even cause brain damage. Adults with kidney problems and high blood pressure can be affected by low levels of lead more than healthy adults.

How Lead Enters our Water
Lead is unusual among drinking water contaminants in that it seldom occurs naturally in water supplies like groundwater, rivers and lakes. Lead enters drinking water primarily as a result of the corrosion, or wearing away, of materials containing lead in the water distribution system and in building plumbing. These materials include lead-based solder used to join copper pipe, brass, and chrome-plated brass faucets. In 1986, Congress banned the use of lead solder containing greater than 0.2% lead, and restricted the lead content of faucets, pipes and other plumbing materials. However, even the lead in plumbing materials meeting these new requirements is subject to corrosion. When water stands in lead pipes or plumbing systems containing lead for several hours or more, the lead may dissolve into the drinking water. This means the first water drawn from the tap in the morning may contain fairly high levels of lead.

Lead in Drinking Water
Lead in drinking water, although rarely the sole cause of lead poisoning can significantly increase a person’s total lead exposure, particularly the exposure of children under the age of 6. EPA estimates that drinking water can make up 20% or more of a person’s total exposure to lead.

For More Information
A copy of the test results is available in our central office for inspection by the public, including students, teachers, other school personnel, and parents, and can be viewed between the hours of 8:30 a.m. and 4:00 p.m. and are also available on our website at ocvts.org. For more information about water quality in our schools, contact Ed Crawford at OCVTS at 732-473-3100.

For more information on reducing lead exposure around your home and the health effects of lead, visit EPA’s Web site at www.epa.gov/lead, call the National Lead Information Center at 800-424-LEAD, or contact your health care provider.

If you are concerned about lead exposure at this facility or in your home, you may want to ask your health care providers about testing children to determine levels of lead in their blood.

Sincerely,

Karen Homiek
Acting Superintendent of Schools
